

Module 1 — Project Overview & Requirement Analysis

Problem Statement, Objectives and Business Requirements

1. Problem Statement

The school IT helpdesk receives multiple incident requests daily from students and teachers, such as Wi-Fi issues, projector failures, password problems, and slow computers.

Currently, IT staff manually reviews each request and assigns a category. This is time-consuming and inefficient.

The project automates ticket classification using ServiceNow Flow Designer by analyzing keywords in the incident Short Description and Description fields.

2. Project Objectives

- Automatically classify incidents at the time of creation.
- Reduce manual effort for IT agents.
- Improve ticket routing efficiency.
- Implement a no-code, easily maintainable solution.

3. Requirement Analysis & Planning

The helpdesk receives requests related to network connectivity, hardware failures, account access problems, and system performance issues.

IT staff currently review each ticket to identify the issue type, select the correct Category and Subcategory, and inform the caller about ticket creation.

The manual process is time-consuming, error-prone, and not scalable as the number of requests increases.

4. Business Requirements

- Automatically classify IT tickets based on the issue description.

Assign both Category and Subcategory without manual intervention.

- Support dependent choice logic between Category and Subcategory.
- Send an automated email notification to the caller upon ticket creation.
- Store ticket information in a structured and standardized format.
- Ensure easy maintenance and future scalability.
